Keywords

Balance Scorecard, Performance Measurement, Productivity improvement, and Public Agency.

Abstract

Improving public agency performance vis-à-vis productivity is the greatest challenge facing the public sector. All over the world, governments have adopted an array of instruments targeted at public institutions, public managers, citizens, and concerned monitoring institutions to enhance public agency performance for productivity improvement. The main objective of this study is to determine the effectiveness of performance measurement using balanced scorecard (BSC) in Lagos Internal Revenue Service (LIRS) with specific reference to how; financial perspectives cum learning affects productivity, customers attitude aid profitability and how internal procedure affects efficiency in service delivery. Primary and secondary data were utilized for the study. Primary data was collected through copies of questionnaire administered on 300 respondents in 30 selected offices out of 40 tax stations spread across the five divisions in Lagos state using stratified and random sampling techniques. The primary data collected was analyzed using both descriptive statistics while the stated hypotheses were tested using regression analysis. Secondary data was sourced from books, journals, internets, newspaper articles and government publications and so on. The study adopts the theory of change (ToC) postulated by Weiss as a theoretical basis. The findings of the study reveal that using the balanced scorecard to measure performance periodically with stakeholders' reflection in LIRS has increased significantly the annual revenue generation in Lagos State. The study recommends among others that more attention should be paid to the provision of adequate incentives as well as training and development on contemporary issues in tax management for tax officers in order to promote their efficiency and effectiveness in developing economies including Nigeria. Furthermore, since citizens' expectation on societal general development and demand varies across divisions and localities in Nigeria; Lagos state government should therefore accommodate the aspirations of the various groups in order to engender sustainable tax compliance by citizens.

Introduction

All over the world, governments have adopted an array of instruments targeted at public institutions, public managers, citizens, and institutional research partners to accomplish improved public agency performance for productivity and sustainability through performance. Performance is a relative concept connected with the phenomenon being studied (Hofer, 1983, Carton 2004). Performance is a multidimensional construct and overwhelmingly contested with various intellectual perception. Performance is a broad concept: it has a choice of meaning for different audiences and diverse contexts (Carter, 1991). Performance must be defined, to measure or manage it (Armstrong & Baron, 1998). Understanding context of the phenomenon of performance in public arena, Wouter (2003) contended that performance is synonymous with reform in public sector aimed at higher performance leading to a better economy, efficiency, effectiveness, equity and ethical relation inevitably leading to performance measurement. Lewis (2015) sees performance measurement as a social structure hinged on a sequence of measurement – a set of interactions with outputs-consequences, which generate a set of corrections in line with unanticipated and undesirable effects. Further, that it is not production model, but about institutions, individuals, interactions and each interrelatedness.

Political policy is foundational formation for performance measure engulfed with a price and visible consequence. It gains more attention with New Public management (NPM) with concern for measurement and more management as citizens begin to actively ask question on institutional performance as they should. Citizens are more passionately apprehensive about the expenditure on public finances (Radin, 2006). Numerous factors have been established for performance measurement and reasons why public managers measure performance, Behn (2003) opined that we measure performance in order to evaluate, control, budget, motivate, promote, celebrate, learn, and improve. Performance measurement is seen as end in itself, its major rationale is to produce measures (Schick, 2001). It implies that three key premises involved in performance measurement are interaction, institution, and citizens. A key factor amidst the hallmarks of PM is to gain insight into and make verdict pertinently on the organization either public or private owned exclusively for effectiveness and efficiency of its programs, processes, and people solely to demonstrate progress with measures (Jääskeläinen & Lönnqvist, 2011).

Performance measurement is systemically interlinked. It encompasses policy makers, stakeholders, leadership, management capacity and capability, employee commitment and goal clarification with appropriate modus operandi which lead to the better sustainable performance of (MDAs-Ministries Department and Agencies) organization to attain efficiency and effectiveness of identified goals. Kelly et al. (2002) classify values created in the public sector to include services, social outcomes, and trust. Services denotes, amplified efficiency, better quality, user's satisfaction, more patronage of services, greater equity (fairness) in service provision. Social outcomes on the other hand implies social cohesion, equality, wealth distribution, safety, poverty reduction, better-educated population, improved health, which represent central aims of public services. Trust is aligned with legitimacy which give societal members a level of satisfactory acceptance of policy accomplishment broadly. A Public sector provide services mainly at cost-effectively and create societal good, value multifaceted thus value is harder to measure (Mulgan & Albury, 2003; Kelly et al., 2002, Bloch & Bugge, 2013).

With an aim to explore new methods of performance measurement, Kaplan and Norton in 1990 led new research to adding other form of creating value and developed Balanced Scorecard (Išoraitė, 2008). Muiruri & Kilika (2015) opined that Balanced Scorecard (BSC) is used strategically in business, industry, government and nonprofit organizations worldwide to ally business actions to the vision and strategy of organizations. It is meant to improve more internal and external communications and monitor organizations' performance against strategic goals. Kaplan & Norton (1992) introduced the new tool as

balance scorecard which captures activities of customer's issues, internal business process, and employee and stakeholders' concerns. It was a tool for organization to manage demand of relevant stakeholders and to convert it into strategy through integration with consideration of four (financial perspective, customer perspective, internal perspective, and learning perspective) framework for balanced scorecard.

The public sector's productivity is a complex and multidimensional with various performance measurement system explored, these include; Benchmarking, Continuous Improvement, Management by Objectives (MBO), Quality Control Circle (QCC) and Key Performance Indicators (KPIs), Critical Success Factors (CSF) Activity-Based Costing/Management (ABC/M), Benchmarking, Total Quality Management (TQM), Business Process Reengineering (BPR) and Balanced Scorecard (BSC) (Zakaria, 2011 and Ruzita Kaveh Asiaei, Ruzita, 2014). Išoraitė (2008) however, maintained that balanced scorecard is a management system that transform the vision, strategy and create a feedback mechanism for internal process and outcomes to persistently improve operational efficiency.

Visionary agenda for Lagos State is designed towards Africa's model megacity and global economic and financial hub that is safe, secure, functional and productive. It is a cosmopolitan city rated the 9th most populated city in the world with about 22 million populations and accounted for 60% of Nigeria industrial investment, foreign trade, and commercial activities, approximately 40% with GDP of \$150bn per annum. (LCCI, 2015). Lagos State encounter with the challenges that accompanied staggering population, expansion rates, and resilience cities from crumbling metropolis into a modern, attractive, and purposeful city through financial meticulousness on her internally generated revenue aided by constancy vis-a-vis consistency on general blueprint followed by each elected leader. Public agencies' manager world-wide face accountability-related challenge to adequately manage cost and are on pursuit to attain increased economy, efficiency, and effectiveness in service delivery (Dixon et al., 1996, Dixon, Kouzmin & Korac-kakabadse 1998, Ho & Kidwell 2000, Cokins 2002, Chakrabarty, 2007).

The pursuit for responsive and consensus-oriented outcome in service delivery and non-reliance on federal allocation prompt the state government looks inward the way of revenue. Through strategic visioning for development, political leaders and the public were able to take deliberate broad long-term human development initiatives as well as envisage plan on the resources required for its accomplishment are devised. Lagos state government commence with strategic initiative of Tax Payer Education and Enlightenment, as a foremost step the state organized a Taxation Stakeholders' Conference in 2007 which was interactive in nature and forum for the State Executive Council to discuss with representative of the Chamber of Commerce, professional groups, financial institution, traditional rulers and market associations e.t.c. The theme of the conference concerned government expectation from them, various means and efforts to radically reform revenue administration in the state. The conference grants feedback of comments, suggestion, and ideas from the stakeholders' interactive platform. It is instructive to note that Taxation Stakeholders' Conference has since become an annual event of the Lagos state government. (Asaolu, Dopemu & Monday, 2015). Lagos State Internal Revenue Service (LIRS) is the major revenue generating public agency of Lagos state since it was set up in 2006 with a strategic measure from an average of 600million in 1999 to 436billion in 2016.

Statement of the Research Problem

In the 1990s, the Lagos State Board of Internal Revenue (LSBIR) apparently unproductive due to peculiarity of Nigeria federalism. The increased level of interest on improving performance measurement in government since the late 1980s championed by the new public management movement and the central planks of the "reinventing government" movement (Osborne & Gaebler, 1992, Greling, 2005, Ruzita, Azhar & Abuhasan 2012). Prior to democratic rule in 1999, one major issue associated with Lagos State was that fund collected on tax within the state was minimal most especially during the military rule in the country.

Following the return to civil rule in 1999, Lagos State Government engaged private sector consultants to assist in tax administration aiming at appropriate taxation policy. Egbonike, Emudainohwo & Gunardi (2018) contended that tax revenue mobilization as a financial source of development is difficult due to various forms of resistance; evasion, avoidance, and corrupt practices which is part of the reasons for underdevelopment in Nigeria (Abata, 2014). Gregory (2008) on his part argued that despite the improvement in the tax system, certain issues require urgent attention.

The democratically elected government engaged consultants to gathered database and information on taxable individual and organization in Lagos. Simon, Simon & Robert (2017) opined that tax administration is challenging in developing economies due to high level of illiteracy, low level of awareness and insufficient orientation. Blessing, Endurance & Stephine (2017) maintained that scarcity of database contributed to tax avoidance. Also, poor naming of streets in major cities like Lagos has made it difficult to locate taxpayers. Apart from this, a large part of the population is poor under-employed and unemployed without visible income. All these factors are militating against effective tax administration in the state. It must be emphasized that public service delivery in Lagos requires huge financial investment because Lagos used to be the nation's capital territory, however, it lacks adequate federal funding. In order to meet the need of the citizens in terms of provision of infrastructural facilities, adequate revenue must be generated within the state.

Revenue generation drive in Lagos State began in early 2005 when government highlighted tax as an area of vital importance to Lagos State. Currently, the LSBIR was exploitative and impose arbitrary levies on the residents without standard of measurement. Citizens without knowledge of tax law were cheated by deceitful personnel. Balanced Scorecard (BSC) was however initiated to review organization performance for certain period. (Su & Baird, 2017; Micheli & Mura, 2017, Sonson, Kulatunga & Pathirage 2017). BSC is a high-quality instrument in the framework of public organizations (Chang, 2006; Niven, 2003; Quilivan, 2000; Smith, 2000). This study seeks to examine the extent to which BSC is used to improve the performance of public agency specifically LIRS in Lagos state, Nigeria.

Objectives of the Study

The main objective of this study is to examine public agency performance measurement using balanced scorecard (BSC) with specific reference to Lagos State Internal Revenue Services. Other specific objectives are to;

1. find out the extent which financial perspectives affective public agency productivity
2. examine the extent to which learning and development aid productivity in LIRS
3. evaluate how customers perspective affect profitability of LIRS
4. investigate how internal perspectives bring about efficient service delivery

Research Questions

1. How does of financial perspective affect public perspective productivity?
2. To what extent development and learning perspective influence productivity?
3. What is the nature of the relationship between customers perspective and profitability?
4. Is there any relationship between internal perspectives and efficient service delivery?

Research Hypotheses

The hypotheses are stated in null form;

1. That there is no relationship between financial perspective and agency productivity.
2. That development and learning perspective does not affect agency productivity.
3. That there is no significant relationship between customers' perspective and profitability.
4. That internal perspective and efficient service delivery does not have any correlation

2. Conceptual and Theoretical Review

The Concept of Performance

Performance is multi-dimensional construct and overwhelmingly debated with various intellectual background perceptions. Meaning of Performance measurement differs, depending on a variety of factors that encompass it (Fitzgerald & Moon, 1996). Public agency performance critical concerns on expenditure (Lewis, 2015). Performance is about work and results achieved (Otley, 1999). Edis (1995) argued that performance is something that the person leaves behind and that exists apart from the purpose. Mwita (2000) contended that performance is an interrelated variable of three: behaviors (processes), outputs, and outcomes (value added or impact) through which designed objectives is achieved. Performance agenda is a new business technique in the public sector with a prototype change oriented on entrepreneurial government (Osbourne & Gaebler, 1993).

This paper posited performance as an interrelated strategic act that embraces an entrepreneurial government that considered human behaviors, output, and outcome in relation to organization goals. Performance cannot be attained without a certain attribute that affect it. Armstrong & Baron (1998) & Mwita (2000) argued that performance factors include; Personnel, Leadership, Team, System, and Contextual (situational) factors which are crucial when measuring, modifying and rewarding performance.

Performance Measurement in Public Sector

There is no universally acceptable definition for the term performance management. What gets measured, get managed (Schmennar & Collmann, 1994; Ibrahim, 2015). Lewis (2015) asserted that performance measurement is a political utilization of data collected and used to exhibit effectiveness against a set of criteria that serve as standard gauge for firms, employee and managers for best practices to achieve optimally for better service. Supporting this notion, Radin (2006) argued that performance measurement commenced in order to eliminate a programme, chant a new path and it is aimed at making the best use of tax income in a transparent way to the public.

Performance measurement implies calculated advancement towards pre-arranged goals, with availability of adequate data efficiently to transform human and material capital into required goods and services for suitable citizenry acceptability. While the notion of measuring the performance of the public sector was certainly existing prior to NPM, its arrival limited the attention of performance to a deliberation of result, with less consideration for how these are achieved (Van Dooren, Bouckaert, & Halligan, 2010, Lewis, 2015). Performance measurement is not alien to the public sector, rather, it becomes intensive with reform agitation pushed regarding public management (Pollitt & Bouckaert, 2011). Schick (2001) claimed that performance measurement has turn out to be an end, its main rationale being to produce more standardized measures. It is symbolic not only to be undertaken as a goal in itself but a designated policy and organizational rationality (Lewis, 2015).

Although the system involves measuring performance in the public sector, certain inherent barriers are associated with it as most governments based it on efficiency, effectiveness and economy indicators that are predicated on finance but failed to measure fulfillment of social and environmental goals of the public institution. Chai & Dung (2009) realigned the "3 Es" (Efficiency, Effectiveness and Economy) to a "5 Es" (Economy, Efficiency, Effectiveness, Environmental and Equity) considering the fact that public organization exists ecologically. Generally, public sector entails requisite of a relationship between objectives, means, and results but the distinctiveness of peculiar bane embedded in process and procedure varies from nations to nation.

Stefanescu et al (2010) identified causes of the complexity of measuring performance in the public sector which include: typology of public sector entities; diversity of perception of performance;

complexity of the economic-social environment; ascendant trend of consumers; discrepancy between the number of consumers and the one of contributors towards the establishment of public resources; managers' low interest for identifying new financing sources; real non-existence of the correlation financial performance – non-financial performance, respectively the influence of the political system. This implies that all public institutions irrespective of category, require a comprehensible and cohesive performance measurement framework at all levels of the organization that supports objectives within the realm of their goals clearly stated for the workforce.

Public Agency and Improving Public Service

Administration of public institutions is based on structure and system irrespective of the system of operation adopted. Ministries, Departments and Agencies (MDAs) serves as platforms for the realization of the policies. Laking (2005) contended that agencies are organizations which are not within the typical government and not integrated institution. Agencies are outside the mainstream of government and has internal modalities but work with germane related rules. OECD (2002) identifies three types of organization that can be differentiated from core government and that are not in a vertically integrated hierarchical relationship with core government organizations namely; *Departmental Agencies* which are core part of ministries with same legal identity, but their internal management is different, and generally operate separately when compared to their parent ministry. *Public law administration* is established with public statute, possessed legal identity under public law at times have board of directors. *Private law bodies* are under direct control of ministers and have governing board. Furthermore, Talbot et al. (2000) identified five agencies in developing and transition economies. These include:

Parastatals: These are business enterprises, corporatized or privatized fully in line with corporate governance rules.

AGETIPs: These are mostly francophone organizations, non-profit in nature for implementing public works.

Social funds: These are designed to finance a variety of projects meant to drastically reduce poverty alleviation sometimes called "social investment funds"

Extra-budgetary fund administrations: examples are pension funds, health insurance funds, agricultural subsidy funds, etc.

Independent revenue authorities (IRAs): These are agencies charged with tax collection and administration within general tax policy.

According to World Bank (2002), Independent revenue authorities (IRAs) are independent agencies that has workforce, provide motivation and thoroughly scrutinized of performance. The LIRS fall within the (IRAs) agency charged with tax collection and administration created by statutory law in 2007. Public service aims at improved social welfare standard for all citizens through service rendered with enhances productivity.

Productivity should not be considered anymore as a possibility, but as an imperative in the current world context, it can be defined as the rate in which products are generated in terms of units of any of these inputs: labour, capital, land and time (Sánchez 2000) Productivity is defined mostly as a measurement of the amount of output generated per unit of input. In many countries, including Nigeria, public sector productivity has been assumed to be zero in the national accounts. The output of the government sector has been measured as of value equal to the total value of inputs. The challenge is to devise alternative estimates based on output measurement, in a public sector context where there is a provision of collective services and where there is no market transaction in services provided to

individuals in most instances. A problem that is generally considered to be the only sustainable way of improving living standards in the long-term.

The Balance Scorecard and adaptation in LIRS at a Glance

The conceptualization of BSC instituted with the private sector mindset and was advocated from both theoretical and practical understanding (Olve, Roy & Wetter, 1999). The BSC framework emphasizes that the financial objectives and more limelight on other the component of performance. These other features of BSC have attracted government and public sector enterprises which have to meet performance management purpose (Aidemark, 2001; Bilkhu-Thompson, 2003; Modell, 2004).

There is upward substantiation on its appropriateness and relevance in the not-for-profit sector, especially the government sector (Atkinson & McCrindell, 1997; Irwin, 2002; Kloot & Martin, 2000; Silk, 1998, Bolívar et al 2010). Furthermore, BSC utilization and outcome in public services likes hospital and healthcare services (Aidemark, 2001; Amaratunga, Haigh, Sarshar, & Baldry, 2002; Chan & Ho, 2000; Chow, Ganulin, Haddad, & Williamson, 1998; Forgione, 1997; Protti, 2002), police services (Elefalk, 2001) and tertiary education (Chang & Chow, 1999; Stewart & Carpenter-Hubin, 2001). Wilson, Hagarty & Gauthier (2003) analyzed the use of BSC in public organizations in different countries and concluded that the BSC approach has proven to be a well-accepted management practice. In the 21st century, public sector has advance from an information method based on financial measures to another broader-based to promote the future success of the organization (Hoque, 2005).

The Balanced Scorecard was conceptualized by Robert Kaplan & David Norton (1992) to formerly shape measurement system and as a reaction to criticism about the one-sided measurement of performance capability of a company on financial portion. The crux of the study was on the increase opinion that fiscal measures of performance not sufficient for the contemporary company. (Išoraite, 2008). Possible alternatives were examined but the team established on the proposal of a scorecard, distinguishing performance measures and consider other activities in the organization; customer related-issues, internal business processes, employee activities in the organization and shareholders disposition. While there are many reasons for measuring the performance of an organization performance measure of an organization remains validly imperative as stakeholders need to know whether or not the organization is fulfilling its purpose (Etim & Agara 2011).

Kaplan & Norton position the Balanced Scorecard as a tool for organizations to manage the demands of all relevant stakeholders and to translate strategies into action. The BSC serves as an indicator to identify two crucial guides: that focuses on the feat of strategic target in the outlook (provided meter) as well as results (underprovided meter) to depict the effectiveness and efficiency of measurement.

Different Perspectives of Balanced Score Card

Different perspectives of BSC can be identified viz:

Financial perspective: Financially, how should our shareholders identify with us in term finance data management. It entails satisfactory fund, prudent utilization of fund and record for proper audit and measurement against cash flow. More often there is more than enough handling and processing of financial data.

Customer perspective: Vision wise, how our appearance aligned with our customers? Modern management ideology has shown an increasing realization of the importance of customer focus and customer satisfaction in any government policy as citizens are more aware and demand better satisfaction on governance provided citizens are not satisfied, human is bound to locate other solution provider. (Kaplan & Norton, 1997, Isoraite 2008)

Internal perspective: Expectation wise of our shareholders, clients and customers, what aspect must stand out and be improved on. This improvement would change the outlook of services when more grey areas are strategically re-defined for efficiency in output.

Learning and Growth perspective: This perspective engulfs and encompass employee training both individual and corporate self-improvement in an organized strategy. Training and organizational attitudes related to both employee and organizational enhancement on learning and growth structure create the groundwork for the accomplishment of organization (Kaplan & Norton, 1997, and Isoraite 2008).

The balanced scorecard is an agenda for setting organization's strategic intention into a lay down blueprint of performance pointer within the BSC framework. With BSC, organization keeps an eye on both its present performance and steps embarked on to progress, inspire and enlighten employees, and enhance information coordination. BSC adoption principally entails premeditated sustainable and long-term dedication to make an organization effective. The severe decline in the price of crude oil in the international market, no doubt has affected finance availability for distribution at national level in Nigeria. This development, no doubt, encourages other tiers mostly state generate revenue from internal sources (Dennis & Emmanuel, 2014). Aguolu (2004) states that though taxation contribution to state resources seems minimal, but to the government, it is the most certain, and consistent source of revenue. This assertion is partly not out of place as LIRS has being one of the most important sources of revenue that is consistent, certain and commendable with each year's revenue from taxation surpassing the previous ones in Lagos State.

Lagos State Internal Revenue Service (LIRS) is the revenue agency of the Lagos State Government engaged with the task of collecting taxes. The aim of the LIRS is to make Lagos State take away its focus from resources accruing to the tiers of government from the Federal Government. The agency has a blueprint on tax system and execute a self-sustained income format to guarantee citizens compliance. The Lagos state government begins to identify the necessity of financial independence, after a long battle between the state and the federal government over revenue withheld by the federal government during President Obasanjo's era. It has become apparent that the state has to strive to survive through revenue generated from taxation. In line with the management's policy of taxpayers' engagement, LIRS has hosted the annual Lagos State Taxation Stakeholders' Conference ever since 2007. The conference provides a forum for The Executive Governor of Lagos State and His Executive Council to converse with representatives of the Chambers of Commerce, professional groups, financial institutions, traditional rulers, and trade & market associations etc. on the various means and efforts to reform tax administration. It must be emphasized that the state government has declared that only 600,000 people pay taxes while over 3.5 million people evade taxes in Lagos State. (<https://lagosstate.gov.ng>).

Situating the above four balanced score card balanced tenets within the context of Lagos state tax administration, the following can be observed;

Financial perspective: The state government established LIRS, make it autonomous and self-accounting in January 2006 by passing it into law. Lagos is the most financially viable in terms of revenue generation in the federation.

Customers perspective: A customer wants value for their commitment, this brings about the initiative on tax education and yearly tax conference of stakeholders where input is required to service the society at large better.

Internal perspective: The process of efficiency and effectiveness are germane, their regular training, once in a week board discussion to discuss feedback from an agency employee and the employees enjoy 13-month salaries in order to promote efficiency in service delivery.

Innovation and learning perspectives: There are series of technologically driven measure put in place for the citizenry which include; online payment as well as online self-assessment tailored towards customer's suitability and comfortability.

Theoretical Framework

This paper is situated within the context of Theory of Change (ToC). Change procedure provides consideration to inputs, processes, outputs, goals, assessment, and evaluation, and learning. In its early conceptualization, Weiss (1995) described Theory of Change (ToC) as "a theory of how and why an initiative works". James (2001) ToC has been developed following two different fields: evaluation processes and part of social change theories. ToC emerged as need to concentrate on poor evaluation practices which were not able to satisfactorily deal with the complexity of initiatives (Center for ToC, 2013) According to Anderson (2004), ToC is a mini-steps that lead to a durable goal and the link connecting activities to the outcomes of a programme.

In the view of Isabel (2012), there is no single definition of what theory of change is and no set methodology. Irma (2018) also argued that Theory of Change is considered from many perspectives: as an approach, a tool, a methodology, a planning methodology, a strategic planning process, and a product. Terminologies associated with ToC include; a pathway of change (Anderson, 2005), the roadmap (Taplin et al., 2013) a blueprint, an engine of change, a theory of action and more. (Stein & Valter, 2012). Stein and Valters (2012) argued that numerous organizations are more contented on ToC as a variant of the 'logic model and sum up ToC through simple "if...then" statements. Collaborating this position, CARE (2012) opined that if there is constructive engagement among key stakeholders on political economy issues, *then* it will improve information flow and lead to a shift in policy and decision making. Moreover, Stein and Valters (2012) categorized the purpose of theory of change into four which include;

Strategic planning: This entails understanding process and outcome for project execution by adopting log frame model.

Monitoring and evaluation: This is concerned with a review and revise outcome for assessment of organization

Description: This focuses on internal and external associate with medium to relate for better engagement.

Learning: This aims at making ToC as a thinking tool for developing model for action.

Retolaza (2011) affirmed that ToC provides practitioner with a prospect to connect more openly with the intricacy of revolutionize procedure. These practitioners' in the view of Shapiro (2004) include:

Changing *individuals:* (involve approach that modify stance and insight, sentiment, manners and encourage partaker in an intervention) the state through the tax conference in 2007 begin to harness and explain the citizen's expectation on tax revenue.

Programmes that center on altering *relationships* (entails new set of connections, partnership, treaty and other supportive bond between members of conflicting groups to fostering social changes that help resolve contending issues). Various contending issues are resolved through the conference as a relationship between state, actors, towards better societal change.

Structural, institutional and systemic changes are the crucial focus for some variance programmes (entails efforts made often directly aimed at legislative, electoral and judicial reform, establishing new mediating mechanisms and forums within society, economic development initiative). The State restructured LSBIRS to LIRS, with legislative backing spread across the five division of Lagos for efficiency and effectiveness.'

The state existence hinged on many interrelated, interdependent and inextricably intertwined boundary aimed at positive change in the society. The change process requires various actors and stakeholders to contribute objectively towards better society coupled with a model to attain organizational vision and strategy. This implies that the state government understands that in achieving sustainable revenue generation, the stakeholder is means to an end and not an end in itself. The tax conference of 2007 sows the seed of all input exchanging materials with its information flow. All ideas, contributions, demand, expectation, and yearning of the citizenry of Lagos state aid policy shift and decision making towards a better robust revenue drive. It is a mini-step that define a long-term goal of viable revenue agency, a pathway of change (Anderson, 2005), the roadmap (Taplin et al., 2013), a blueprint, an engine of change, a theory of action and more. (Stein & Valter, 2012).

Empirical Review

BSC is one of the most broadly used tools by executive worldwide, the research on the BSC cut across different fields; hospitality and tourism, education, health sector accounting and management and public sector service (Trotta, Cardamone, Cavallaro, & Mauro, 2012; Sayed, 2013, Dreveton, 2013; Madsen, 2015; Palatková, 2015). Also, Quesado, Guzmán and Rodrigues (2012) in their empirical research situated in context of theories of contingencies and institutional model, with aim to reveal advantages derived from the implementation of the BSC in Portuguese public organizations precisely area of borough, health and /inter-municipal business. The outcome of the study revealed that 91.7% respondents explained that BSC facilitated implementation of the strategy and has a positive influence on development of more strategies. It prompted enhancement in organizational performance (83.3%), promote lucid communication of the strategy (75%).

Furthermore, Quesado, Aibar & Lima (2018) identify and analyses effect derived from BSC execution, their findings include; that the BSC has these tasks; performance appraisal system, transform the mission and organizational tactic, support more feasible means of communication procedure, the strategic alignment and improve overall organizational learning. Bhagwat and Sharma (2007) also researched three case studies in India, the outcome established that BSC help internal and external function better with wider monitoring of organization business.

Hoque & James (2000), in a study conducted in 66 Australian industrialized corporations, concluded that the BSC promotes advancement of organizational performance. Muiruri & Kilika (2015) collaborated the Hoque & James in their study on some selected public sector organizations in Kenya relating to the BSC on Performance of Public sector and four BSC perspective in Kenya. The findings revealed that 71% difference in performance is ascribed to the BSC as a tool for use in strategic management is relevant for application in the public sector however, its comparatively low score on innovation due to the widespread bureaucratic cultural surroundings of the sector.

3. Methodology

This study adopted a qualitative approach using a primary data obtained through self-administered questionnaires to the respondents. The population of the study comprised all tax stations in Lagos State spread across the 20 Local Government Areas (LGAs) and 37 Local Council Development Areas (LCDAs). There are one thousand, four and one (1,401) employees working in the fifty-seven (57) LGAs& LCDAs in Lagos state. Using Yamane's (1973) sampling formula for sample size determination, a sample size of 40 tax stations and 302 employees were selected using simple random sampling and stratified random sampling techniques respectively. The sample size formula is given as:

$$n = N / (1 + N (e)^2)$$

where:

n = sample size

N = population size

e = error term (minimum margin error 5%).

Determination of sampled tax stations in Lagos state given that $N = 57$, $e = 0.05$

$n = 57 / [1 + 57 (0.05)^2] = 49$ Tax Stations

Determination of sampled employees working in tax stations in Lagos state given that $N = 1201$, $e = 0.05$

$n = 1401 / [1 + 1401 (0.05)^2] = 300$ Respondents

Three hundred (300) copies of the questionnaire were administered to selected respondents in the selected forty (40) tax stations in Lagos state. The area was chosen because the researcher anticipated that it will provide all the necessary information for the study. The results were presented in simple visual forms using tables. The regression and correlation tools of analysis were used to show how public agency performs using balanced scorecard in Lagos State Internal Revenue Service (LIRS).

Cronbach's Alpha coefficient of reliability was calculated for six (6) major constructs. The results show that the research instrument reliable and internally consistent since the Cronbach's Alpha result for all the construct is greater than 0.7. The result of the pilot study indicates a high level of internal consistency for seven (7) constructs: Financial Perspective (0.749), Development and Learning Perspective (0.824), Customers' Perspective (0.776), Internal Perspective (0.862), Productivity (0.777), Profitability (0.810) and Efficient Service Delivery (0.910). The benchmark for reliability Cronbach's Alpha score is .70 as recommended by Nunnally (1978). Thus, all the constructs have above the minimal 0.70; therefore, the overall reliability of the scale is guaranteed.

The information retrieved from the questionnaires revealed that Two hundred and twelve (212) copies of the questionnaire were fully completed which gives a 71% response rate. Majority of the respondents are male, single with BSC/HND qualifications within the age range of 30-39 years and 5- 10 years job experience. This implies that the agency considers goal attainment in the selection of its workforce as it picks active workforce.

4. Data Analysis and Discussion

Hypothesis Testing

In this section, attempt is made to test the stated hypotheses using Pearson Product Moment Correlation Coefficient and Regression Analysis

Hypothesis one

There is no relationship between financial perspective and agency productivity.

Pearson Product Moment Correlation was used to test this hypothesis.

Table 2: Correlations

		FINANCIAL PERSPECTIVE	PRODUCTIVITY
FINANCIAL PERSPECTIVE	Pearson Correlation	1	.850*
	Sig. (2-tailed)		.029
	N	212	212
PRODUCTIVITY	Pearson Correlation	.850*	1
	Sig. (2-tailed)	.029	
	N	212	212

*. Correlation is significant at the 0.05 level (2-tailed).

The Pearson Product Moment Correlation Coefficient result suggests that there is a positive relationship between financial perspective and productivity ($r = 0.852$). This relationship is statistically significant because the p-value for the result (0.029) is less than the level of significant (0.05) used for the study. This suggests that financial perspective is related to productivity positively and significantly.

Decision

Null hypothesis was rejected, while the alternative hypothesis was accepted. This implies that there is a significant positive relationship between financial perspective and agency productivity.

Hypothesis two

Development and learning perspective do not affect agency productivity.

Table 3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.920 ^a	.846	.844	.035

a. Predictors: (Constant), LEARNINGPERSPECTIVE

Regression analysis was used to show the extent to which development and learning perspective affects agency productivity at 5% level of significance. The results are as presented in Tables 3 to 5 showing the regression model summary, ANOVA and the regression coefficients respectively.

The model summary in table 3 shows that the coefficient of determination (R-square) is 0.846. This means that 84.6% of the variance recorded in productivity is accounted for by development and learning perspective. The result is statistically significant because the p-value for the result (0.000) is less than the

Table 4: ANOVA^a

Model	Sum of Squares	Df	Mean Square	F	Sig.
1 Regression	34.156	1	34.156	64.766	.003 ^b
Residual	110.746	210	0.519		
Total	144.902	211			

a. Dependent Variable: PRODUCTIVITY

b. Predictors: (Constant), LEARNING PERSPECTIVE

level of significant (0.05)

Table 3 shows that the model used has a good fit since the calculated F ratio of 64.766 is greater than the tabulated F ratio value of 3.00 ($F_{1,210} = 3.00$).

Table 5: Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error			
1 (Constant)	3.664	.037		2.991	.000
LEARNING PERSPECTIVE	0.17	.009	.119	1.744	.003

a. Dependent Variable: PRODUCTIVITY

The simple regression model is given as:

$$P = 3.664 + 0.17LP$$

An evaluation of the unstandardized coefficient of learning perspective in the coefficient table and its associated p-value ($\beta_{LP} = 0.17$, $p < 0.05$) shows that learning perspective is statistically significant and *can* be used in predicting productivity. This signifies that for every unit increase in learning perspective, productivity is increased by 17 percent.

Decision

Null hypothesis is rejected while the alternative hypothesis is accepted. This means development and learning perspective affects agency productivity significantly.

Hypothesis three

There is no significant relationship between customers' perspective and profitability. Pearson Product Moment Correlation was used to test this hypothesis.

Table 6: Correlations

		CONSUMER PERSPECTIVE	PROFITABILITY
CONSUMER PERSPECTIVE	Pearson Correlation	1	.862**
	Sig. (2-tailed)		.000
	N	212	212
PROFITABILITY	Pearson Correlation	.862**	1
	Sig. (2-tailed)	.000	
	N	212	212

** . Correlation is significant at the 0.01 level (2-tailed).

The Pearson Product Moment Correlation Coefficient result suggests that there is a positive relationship between consumer perspective and profitability ($r = 0.862$). This relationship is statistically significant because the p-value for the result (0.000) is less than the level of significant (0.05) used for the study. This suggests that consumer perspective is related to profitability positively and significantly.

Decision

Null hypothesis was rejected, while the alternative hypothesis was accepted. This implies that there is a significant positive relationship between customers' perspective and profitability.

Hypothesis four

Internal perspective and efficient service delivery does not have any correlation.

Table 7: Correlations

		INTERNAL PERSPECTIVE	EFFICIENCY IN SERVICE DELIVERY
INTERNAL PERSPECTIVE	Pearson Correlation	1	.731**
	Sig. (2-tailed)		.000
	N	212	212
EFFICIENCY IN SERVICE DELIVERY	Pearson Correlation	.731**	1
	Sig. (2-tailed)	.000	
	N	212	212

** . Correlation is significant at the 0.01 level (2-tailed).

Pearson Product Moment Correlation was used to test this hypothesis. The Pearson Product Moment Correlation Coefficient result suggests that there is a positive relationship between internal perspective and efficient service delivery ($r = 0.731$). This relationship is statistically significant because the p-value for

the result (0.000) is less than the level of significant (0.05) used for the study. This suggests that internal perspective correlate with efficient service delivery significantly.

Decision

Null hypothesis was rejected, while the alternative hypothesis was accepted. This implies that there is a significant positive relationship between internal perspective and efficient service delivery.

3.1.5 Table 8: Summary of the findings

Hypotheses	Tools of Analysis	Models	Result
There is no relationship between financial perspective (X_1) and agency productivity (Y_1)	Correlation	$X_1 \leftrightarrow Y_1$	$p < 0.05$; H_1 rejected.
Development and learning perspective (X_2) does not affects agency productivity (Y_1).	Regression	$Y_1 = a + bX_2$	$p < 0.05$; H_2 rejected.
There is no significant relationship between customers' perspective (X_3) and profitability (Y_2).	Correlation	$X_3 \leftrightarrow Y_2$	$p < 0.05$; H_3 rejected.
Internal perspective (X_4) and efficient service delivery (Y_3) does not have any correlation	Correlation	$X_4 \leftrightarrow Y_3$	$p < 0.05$; H_4 rejected.

5. Discussion of Findings

The study investigated improving public revenue agency and performance measurement using balanced scorecard (BSC). The findings revealed that 65% variation in revenue agency performance can be attributed to the effectiveness and efficiency of their balance scorecard components. This outcome is in line with the findings of Madsen (2013) who interviewed 39 managers of Scandinavian organizations and adopted the BSC, and found that; BSC improve processes related to performance measurement, budgeting, and strategy, organizational politics, and changes, broader cultural and social trends and finally it increased focus on being 'balanced' and take into account more than just financial performance measures.

Quesado et al (2018) documented that BSC allows organizations to build a high-performance culture, to the extent that it promotes the alignment of key indicators to the strategic objectives of the company in each and every organizational level. The primary purpose of the BSC is to help implement a strategy, Kaplan, and Norton (1996, 2001). First hypothesis outcome revealed that there is a relationship between the financial perspective and agency productivity. This aligned with research outcome on level of efficiency and effectiveness of operational cost conducted by (Wu, Lin and Chang, 2011; Suhendi, 2012; Christina and Sudana, 2013; Nur, 2013; Rumintjap, 2013; Angriani, 2014; Antariksa et al., 2014; Quezada et al., 2014; Sudaryo, 2015). In 2006, the state government passed a law to make LIRs financial autonomous and maximize to the betterment of the state significantly.

Secondly, it was discovered that development and learning perspective does affect agency productivity positively. On a percentage basis, 84.6% of the variance recorded in productivity is accounted for by development and learning perspective. This equally collaborated with research on learning and growth perspective on staff capability (Wu et al., 2011; Fooladvand et al., 2015) improvement of manpower quality (Wu et al., 2011; Suhendi, 2012), employees' education level (Hermawan, 2008), work experience (Hermawan, 2008), number of education and training (Suhendi, 2012; Christina and Sudana,

2013; Nur, 2013; Rumintjap, 2013; Angriani, 2014), with more adequate staff capability, improvement on manpower quality, training and development productivity level turned out to be remarkable.

Thirdly, there is a significant relationship between customers' perspective and profitability. This collaborated empirical findings on improving service quality (Wu et al., 2011; Nur, 2013; Quezada et al., 2014; Fooladvand et al., 2015), value of customer satisfaction (Hermawan, 2008; Sukesti, 2010; Tohidi et al., 2010; Wu et al., 2011; Aljardali et al., 2012; Effendi, 2012; Suhendi, 2012; Atafar et al., 2013; Rumintjap, 2013; Santhi et al., 2013; Angriani, 2014; Antariksa et al., 2014; Quezada et al., 2014; Fooladvand et al., 2015; Sudaryo, 2015) consistent with customer expectation (Atafar et al., 2013) and timely delivery (Fooladvand et al., 2015). It implies that organization that modifies its services to suit customers would experience a steady increase in patronage of services and the agency profitability will continue to grow.

Finally, internal perspective and efficient service delivery have correlation. This isline with research conducted on utilization of new technology (Suhendi, 2012; Aljardali et al., 2012), capability of information system (Wu et al., 2011; Suhendi, 2012; Angriani, 2014; Fooladvand et al., 2015). The findings of the study subscribe to the fact that overall performance over the years improved significantly with a premeditated course of BSC integration into LIRS.

6. Conclusion

Revenue is equivalent to the human blood in governance, it's not only important but imperative for general societal good. Financial performance occupies a significant place in the agency operation. However, other factors of a balanced scorecard that are interrelated indicator and can promote positivity in strategic goals, boost learning productivity and efficiency in service delivery should always be reexamined to meet citizen's satisfaction leading to economic efficiency of the enterprise. More so, the need to ensure process, procedure and pressured are mounted on an employee to be more productive, organization and citizens to file a tax return as at when due would bring better development in all ramifications.

7. Recommendations

On the basis of the above, it is recommended that the agency, LIRS, should adopt more feedback mechanism from citizens and staff for a better strategy which serve as a manifestation of its progression, output of the mechanism will be important to encourage this process of better agency role. The implication of these feedback on service delivery should be identified and reported to all key stakeholders. Each local government areas and local council development areas in Lagos state that constitutes the State has certain peculiarities. The State government should find a way to harmonize and harness their needs in order to avoid a reduction in revenue generation over issues of non-performance that may be associated with such division. Furthermore, it is important to recognize how to capture the informal sector towards improving agency revenue drive. The state government should strengthen tax audit in order to discover organizations and individuals that ceased to file returns annually and companies that declare distrustful profits.

Also, Balanced Score Card (BSC) reports should be made accessible to stakeholders in Lagos state and developing economies in general so as to be able to monitor progress in the areas of tax management and administration.

There is the need for government policies to be more citizen friendly so as to aid the growth of businesses in the state and also boost the revenue drive in Nigeria and other developing economies. Also, more should be done in terms of provision of infrastructural facilities, which can also assist in increasing revenue generation in developing economies. In addition, other loophole through which tax are being

evaded can be blocked by embarking on more modern sophisticated technology with appropriate database of all companies since Lagos is the economic capital of Nigeria.

Finally, machinery should be put in place to monitor the impact of the implementation of strategic initiatives on the achievement of the BSC objectives in order to help the public agencies and organizations to better understand the performance drivers which can lead to more effective and efficient use of limited resources in developing economies.
